SUICIDE RISK ASSESSMENT - SAD PERSONS

Sex (male)	-
Age (25-34; 35-44; 65+)	
Depression	
Previous attempt	
Ethanol abuse	-
Rational thinking loss (psychosis)	
Social support lacking (or loss of loved one)	
Organized plan	
No spouse	
Sickness	

TOTAL:

- 0-2 equals little risk, (unless previous attempt and/or rational thinking impaired)
- 3-4 equals following patient closely,
- 5-6 equals strongly considering hospitalization,
- 7-10 equals a very high risk, hospitalize or commit.

Suicide risk assessment and management: A systematic evidence review for the Clinical practice guidelines for emergency departments and mental health services project (2010)

Risk factors	Protective factors	
Past psychiatric history	1. Good communication with family members	
2. Current mental illness	2. Problem-solving confidence	
3. Comorbidity	3. Social connectedness	
4. Family relationship disturbance	4. Locus of control	
5. Recent suicide of somebody close	5. Reasons for living	
6. Childhood physical/sexual abuse		
7. Unipolar depressive disorder		
8. Hopelessness		
9. Worthlessness		
10. Drug/alcohol abuse/dependence		
11. Impulsivity		
12. Self-harm		
13. Suicidal ideation		
14. Prior suicide attempt		
15. Stressful life events		
16. Physical illness		
17. Social isolation		
18. Psychiatric illness and/or substance abuse		
during pregnancy or postnatal period		
19. Antidepressant use		
20. Psychiatric hospitalisation		

IF SIGNS PRESENT: Use clinical judgement to admit patient or refer patient to their local clinic (list available with clinics rendering mental health services)

INDIVIDUAL RISK PROFILE: Male Ages 15-35 Age over 65 Family history of suicide Chronic medical illness Psychiatric illness Poor social supports/social isolation Substance abuse Sexual/physical abuse SYMPTOM RISK PROFILE: Depressive symptoms Positive psychotic symptoms Hopelessness Worthlessness Anhedonia Anxiety/agitation Panic attacks Anger Impulsivity INTERVIEW RISK PROFILE: Recent substance use Suicidal ideation Suicidal intent Suicidal plan Access to lethal means Past suicide behaviour Current problems seem unsolvable to patient Suicidal/violent command hallucinations LEVEL OF SUICIDE RISK: High Moderate	WIDDING DICK DOCKET		
Male Ages 15-35 Age over 65 Family history of suicide Chronic medical illness Psychiatric illness Poor social supports/social isolation Substance abuse Sexual/physical abuse SYMPTOM RISK PROFILE: Depressive symptoms Positive psychotic symptoms Hopelessness Worthlessness Anhedonia Anxiety/agitation Panic attacks Anger Impulsivity INTERVIEW RISK PROFILE: Recent substance use Suicidal ideation Suicidal intent Suicidal plan Access to lethal means Past suicide behaviour Current problems seem unsolvable to patient Suicidal/violent command hallucinations	INDIVIDUAL RISK PROFILE:	YES	N
Age over 65 Family history of suicide Chronic medical illness Psychiatric illness Poor social supports/social isolation Substance abuse Sexual/physical abuse SYMPTOM RISK PROFILE: Depressive symptoms Positive psychotic symptoms Hopelessness Worthlessness Anhedonia Anxiety/agitation Panic attacks Anger Impulsivity INTERVIEW RISK PROFILE: Recent substance use Suicidal ideation Suicidal intent Suicidal plan Access to lethal means Past suicide behaviour Current problems seem unsolvable to patient Suicidal/violent command hallucinations			
Age over 65 Family history of suicide Chronic medical illness Psychiatric illness Poor social supports/social isolation Substance abuse Sexual/physical abuse SYMPTOM RISK PROFILE: Depressive symptoms Positive psychotic symptoms Hopelessness Worthlessness Anhedonia Anxiety/agitation Panic attacks Anger Impulsivity INTERVIEW RISK PROFILE: Recent substance use Suicidal ideation Suicidal intent Suicidal plan Access to lethal means Past suicide behaviour Current problems seem unsolvable to patient Suicidal/violent command hallucinations	Ages 15-35
